

G Performer 4.0 *Growth and efficiency*

Maintain a high health status

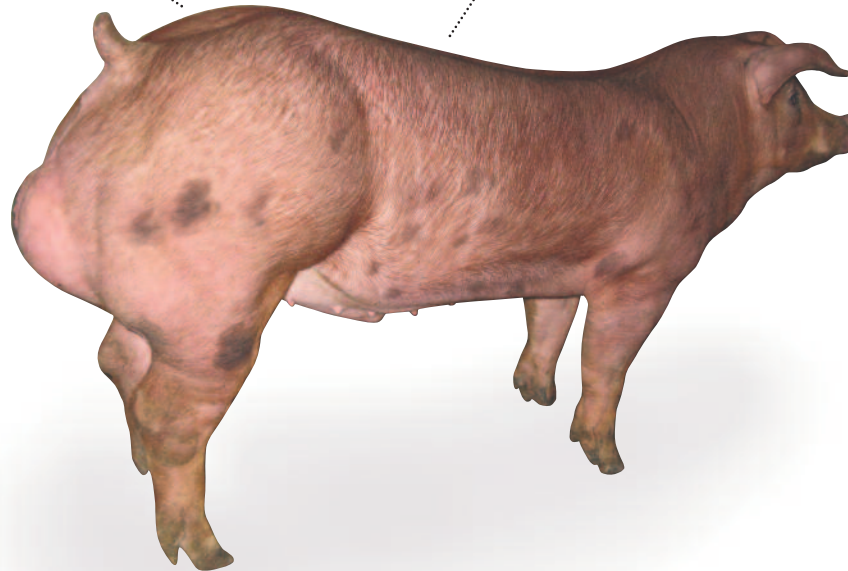

World leader in biosecurity for more than 25 years, Genetiporc is producing high health terminal boars in order to protect its customers from primary disease introduction and their associated economic impacts, reducing mortality cost and lost productivity.

Reduce production cost

The G Performer fourth generation has been developed to maximize growth and to reduce feed conversion. This terminal boar line will allow for maximum piglet hardiness, low mortality, and decreased production costs through feed efficiency and consistent average daily gain.

Maximize meat gain

This new edition of the G Performer 4.0 produces pigs with an excellent meat yield combined with high slaughter index. Color and intramuscular fat are optimized in meeting slaughter and further processing requirements.
